1 ABOUT THESE INSTRUCTIONS

The operating instructions describe the entire life cycle of the device.
→ Keep these instructions ready to hand at the operation site.

Important safety information.
▶ Carefully read these instructions.
▶ Observe in particular the safety instructions, intended use and operating conditions.
▶ Persons, who work on the device, must read and understand these instructions.

1.1 Symbols

⚠️ DANGER
Warns of an immediate danger.
▶ Failure to observe the warning will result in a fatal or serious injury.

⚠️ WARNING
Warns of a potentially dangerous situation.
▶ Failure to observe the warning may result a fatal or serious injury.

⚠️ CAUTION
Warns of a possible danger.
▶ Failure to observe the warning may result in moderate or minor injuries.

ATTENTION
Warns of damage to property.
▶ Failure to observe the warning may result in damage to device or system.

⚠️ Indicates important additional information, tips and recommendations.

📖 Refers to information in these operating instructions or in other documentation.

▶ Indicates an instruction for risk prevention.
→ Indicates a procedure which you must carry out.
✔ Indicates a result.

Menu Indicates a interface text.
1.2 Definition of terms

In these instructions the term “device” denotes the following device types:
Positioner Type 8694 REV.2
The term “büS” (Bürkert system bus) used in this instruction stands for the communication bus developed by Bürkert and based on the CANopen protocol.
In these instructions, the abbreviation “Ex” always refers to “potentially explosive atmosphere”.

1.3 Firmware changes

<table>

</tr>
</thead>
<tbody>
<tr>
<td>A.1.6</td>
<td>Display of “valve position half-way” changed from “LED off” to “LED is lit white”</td>
</tr>
</tbody>
</table>
2 INTENDED USE

The Positoner Type 8694 REV.2 is designed to be mounted on pneumatic actuators of process valves for the control of media. The permitted fluid media are listed in the technical data.

▶ Use the device for its intended purpose only. Non-intended use of the device may be dangerous to people, nearby equipment and the environment.

▶ Correct transportation, correct storage as well as correct installation, commissioning, operation and maintenance are essential for reliable and problem-free operation.

▶ When using the device, observe the permitted data, operating conditions and application conditions. This information can be found in the contractual documents, the operating instructions and on the type label.

▶ Use the device only in conjunction with third-party devices and components recommended and authorized by Bürkert.

▶ Do not use the device outdoors without protection from the weather.

▶ In potentially explosive atmosphere, only use devices approved for use in those areas. These devices are labeled with a separate Ex type label. For such use, note the information provided on the separate Ex type label and the additional explosion-related information or separate explosion-related operating instructions.
3 BASIC SAFETY INSTRUCTIONS

These safety instructions do not consider any contingencies or incidents which occur during installation, operation and maintenance.

The operator is responsible for observing the location-specific safety regulations, also with reference to the personnel.

⚠️ DANGER

Risk of injury from high pressure and discharge of medium.
▶ Before working on the device or system, switch off the pressure. Vent or drain lines.

⚠️ DANGER

Risk of injury from electric shock.
▶ Before working on the device or system, switch off the power supply. Secure against reactivation.
▶ Observe applicable accident prevention and safety regulations for electrical equipment.

⚠️ To prevent injury, ensure the following:
▶ Secure device or system to prevent unintentional activation.
▶ Only trained technicians may perform installation and maintenance work.
▶ Perform installation and maintenance with suitable tools only.
▶ Do not make any changes to the device and do not subject it to mechanical stress.
▶ Operate the device only in perfect state and in consideration of the operating instructions.
▶ Observe the general rules of technology.
▶ Install the device according to the regulations applicable in the respective country.
▶ Do not feed corrosive or flammable media into the device connections.
▶ Do not feed any fluids into the connections of the device.
▶ After the process is interrupted, restart in a controlled manner. Observe sequence:
1. Connect electrical or pneumatic power supply.
2. Charge the device with medium.
▶ Observe intended use.

⚠️ ATTENTION!

Electrostatic sensitive components or modules.
The device contains electronic components, which react sensitively to electrostatic discharge (ESD). Contact with electrostatically charged persons or objects is hazardous to these components. In the worst case scenario, they will be destroyed immediately or will fail after start-up.
▶ Observe the requirements in accordance with EN 61340-5-1 and to minimize or avoid the possibility of damage caused by sudden electrostatic discharge.
▶ Also ensure that you do not touch electronic components when the power supply is on.
4 GENERAL INFORMATION

4.1 Contact address

4.4 Information on the internet

The operating instructions and data sheets for Type 8694 can be found on the Internet at:
www.burkert.com
5 SYSTEM DESCRIPTION

5.1 Intended application area
The positioner Type 8694 is designed to be mounted on pneumatic actuators of process valves for the control of media.

5.2 Function of the positioner and combination with valve types
Positioner Type 8694 is an electropneumatic position controller for pneumatically actuated control valves with single-acting actuators.

Together with the pneumatic actuator, the positioner forms a functional unit.

The control valve systems can be used for a wide range of control tasks in fluid technology and, depending on the application conditions, different process valves belonging to series 2103, 2300, 2301, 26xx or 27xx from the Bürkert range can be combined with the positioner. Angle-seat valves, diaphragm valves or ball valves fitted with a control cone are suitable.

“Figure 1” shows an overview of the possible combinations of positioner and different pneumatically actuated valves. Different actuator sizes and valve nominal widths, not illustrated here, are available for each type. More precise specifications can be found on the respective data sheets. The product range is being continuously expanded.

![Positioner Type 8694](image)

**Figure 1:** Overview of possible combinations

- with angle seat valve Type 2300
- with straight seat valve Type 2301
- with angle seat valve Type 2702
- with diaphragm valve Type 2730
The position of the actuator is regulated according to the position set-point value. The position set-point value is specified by an external standard signal.

Pneumatically actuated piston actuators and rotary actuators can be used as an actuator. Single-acting actuators are offered in combination with the positioner.

For single-acting actuators, only one chamber is aerated and deaerated in the actuator. The generated pressure works against a spring. The piston moves until there is an equilibrium of forces between compressive force and spring force.

5.3 Features of the valve types

<table>
<thead>
<tr>
<th>Types</th>
<th>Angle seat control valves / straight seat control valves</th>
<th>Diaphragm valves</th>
<th>Ball valves</th>

<td>2672 2675</td>
</tr>
</tbody>
</table>
| Features | • incoming flow under seat  
• no closing impact  
• straight flow path of the medium  
• self-adjusting stuffing box for high leak-tightness | • medium is hermetically separated from the actuator and environment  
• cavity-free and self-draining body design  
• any flow direction with low-turbulence flow  
• steam-sterilizable  
• CIP-compliant  
• no closing impact  
• actuator and diaphragm can be removed when the body is installed | • scrapable  
• minimum dead space  
• unaffected by contamination  
• little pressure loss compared to other valve types  
• seat and seal can be exchanged in the three-piece ball valve when installed  
Note can be used as process controller only | • unaffected by contamination  
• little pressure loss compared to other valve types  
• inexpensive  
• low construction volume |
| Typical media | • water, steam and gases  
• alcohols, oils, propellants, hydraulic fluids  
• salt solutions, lyes (organic)  
• solvents | • neutral gases and liquids  
• contaminated, abrasive and aggressive media  
• media of higher viscosity | • neutral gases and liquids  
• clean water  
• slightly aggressive media | • neutral gases and liquids  
• slightly aggressive media |

Table 1: Features of the valve types
5.4 Structure of the positioner

The positioner Type 8694 consists of the micro-processor controlled electronics, the position sensor and the pilot valve system. The positioner is operated via 2 buttons and a 4-pole DIP switch. The pilot valve system for single-acting actuators consists of 2 solenoid valves.

5.4.1 Representation

![Diagram of the positioner]

- Transparent cap
- Body casing
- Pressure limiting valve (for protection against too high internal pressure in case of error)
- Basic housing
- Exhaust air connection (label: 3)
- Pressure supply connection (label: 1)
- Buttons
- Communications interface
- LED
- DIP Switches
- Air intake filter (exchangeable)
- Electrical connection (cable gland M16 x 1.5 or circular plug-in connector M12 x 1)
- Additional exhaust air port (label: 3.1) only for Type 23xx and 2103 with pilot valve system for high air flow rate (actuator size ø 130)

Figure 2: Structure
5.4.2 Features

• Models
  for single-acting valve actuators.

• Position sensor
  Contactless and therefore wear-free position sensor.

• Microprocessor-controlled electronics
  for signal processing, control and valve control.

• Control module
  The device is controlled via 2 buttons and a 4-pole DIP switch.

• Pilot valve system
  The control system consists of 2 solenoid valves. One valve is used to aerate and another to deaerate the pneumatic actuator. The solenoid valves operate according to the rocker principle and are controlled with a PWM voltage via the controller. Doing so achieves a higher flexibility with regard to actuator volume and final control speed. The low air flow rate model has an orifice of DN 0.6. In larger pneumatic actuators the solenoid valves feature diaphragm amplifiers to increase the maximum flow and therefore to improve the dynamics (DN 2.5).

• Position feedback
  The position of the valve can be transmitted to the PLC via an analog 0/4-20 mA output (variant, without fieldbus communication) or digitally via a fieldbus communication (e.g. büS, IO-Link).

• Digital input (for variant without fieldbus communication)
  If a voltage > 10 V is applied, safety position (SAFEPOS) is activated*, i.e. the valve is moved to the safety position (factory setting, can be changed with communications software).

• Pneumatic interfaces
  G1/8” connections
  hose plug-in connection Ø6 mm

• Electrical interfaces
  Circular plug-in connector or cable gland

• Housing
  The housing of the positioner is protected from excessively high internal pressure, e.g. due to leaks, by a pressure limiting valve.

• Communications interface
  For exchanging process data and for configuration and parameterization.
5.4.3  Function diagram of the positioner with single-acting actuator

The illustrated function diagram describes the function of the positioner (Type 8694).

Figure 3: Function diagram
5.5 Type 8694 positioner (position controller)

The position sensor records the current position (POS) of the pneumatic actuator. The position controller compares this actual position value with the set-point value (CMD) which is definable as standard signal. In case of a control deviation (Xd1), a pulse-width modulated voltage signal is sent to the pilot valve system as a manipulated variable. If there is a positive control difference in single-acting actuators, the air inlet valve is controlled via output B1. If the control difference is negative, the bleed valve is controlled via output E1. In this way the position of the actuator is changed until control difference is 0. Z1 represents a disturbance variable.

#### Table 4: Auxiliary functions

<sup>4)</sup> Only for variant without fieldbus communication.
5.6 Interfaces of the positioner

The positioner Type 8694 must be operated in 3-wire or 4-wire connection, i.e. the power (24 V DC) is supplied separately from the set-point value signal.

- Input for position set-point value\(^7\) (4 – 20 mA corresponds to 0 – 100 % (depending on position of DIP switch 1)).
- Digital input\(^7\)
  If a voltage > 10 V is applied, safety position (SAFEPOS) is activated, i.e. the valve is moved to the safety position (factory setting, can be changed with communications software).
- Analog position feedback (variant)\(^7\)
  The position of the valve can be transmitted via an analog 4 – 20 mA output to the PLC (4 – 20 mA corresponds to 0 – 100 %).

\(^5\) Or via fieldbus communication (büS/CANopen or IO-Link)
\(^6\) Factory setting is 4 – 20 mA, 4-wire
\(^7\) Only for variant without fieldbus communication.
6  TECHNICAL DATA

6.1  Conformity

In accordance with the EU Declaration of conformity, the positioner Type 8694 is compliant with the EU Directives.

6.2  Standards

The applied standards on the basis of which compliance with the EU Directives is confirmed are listed in the EU type examination certificate and/or the EU Declaration of Conformity.

6.3  Licenses

The product is approved for use in zone 2 and 22 in accordance with ATEX directive 2014/34/EU category 3GD.

⚠️ Observe instructions on operation in an explosion-risk (Ex) area.
⚠️ Observe the ATEX additional instructions.

The product is cULus approved. Instructions for use in the UL area see chapter “6.8 Electrical data”.

6.4  Operating conditions

⚠️ WARNING!

Solar radiation and temperature fluctuations may cause malfunctions or leaks.
- If the device is used outdoors, do not expose it unprotected to the weather conditions.
- Ensure that the permitted ambient temperature does not exceed the maximum value or drop below the minimum value.

Ambient temperature: see type label

7 CONTROL AND DISPLAY ELEMENTS

The following chapter describes the operating statuses as well as the control and display elements of the positioner. Further information on the operation of the positioner can be found in the chapter entitled “13 Start-up”.

7.1 Operating state

To operate the DIP switches and buttons, make sure that the local control lock is deactivated/unlocked (factory setting): with communication software or fieldbus communication.

AUTOMATIC (AUTO)
Normal controller mode is implemented and monitored in AUTOMATIC operating state.

MANUAL
In MANUAL operating state the valve can be opened and closed manually via the buttons. DIP switch 4 can be used to switch between the two operating states AUTOMATIC and MANUAL.

7.2 Control and display elements of the positioner

To operate the DIP switches and buttons, make sure that the local control lock is deactivated/unlocked (factory setting): with communication software or fieldbus communication.

The positioner features 2 buttons, 4-pole DIP switches and 2 LEDs as a display element.

ATTENTION!
Breakage of the pneumatic connection pieces due to rotational impact.

- When unscrewing and screwing in the body casing or transparent cap, do not hold the actuator of the process valve but the basic housing.

→ To operate the buttons and DIP switches, unscrew the transparent cap.
ATTENTION!

Damage or malfunction due to penetration of dirt and humidity.

▶ To observe degree of protection IP65 / IP67, screw the transparent cap in all the way.

→ Close the device (assembly tool: 674077\textsuperscript{12}).

---

\textsuperscript{12}) The assembly tool (674077) is available from your Bürkert sales office.
7.3 Configuration of the buttons

To operate the DIP switches and buttons, make sure that the local control lock is deactivated/unlocked (factory setting): with communication software or fieldbus communication.

The configuration of the 2 buttons varies depending on the operating state (AUTOMATIC / MANUAL).

The description of the operating states (AUTOMATIC / MANUAL) can be found in the chapter entitled “7.1 Operating state”.

ATTENTION!

Breakage of the pneumatic connection pieces due to rotational impact.

- When unscrewing and screwing in the body casing or transparent cap, do not hold the actuator of the process valve but the basic housing.

→ To operate the buttons, unscrew the transparent cap

MANUAL operating state (DIP switch 4 set to ON):

</tr>
</tbody>
</table>

Table 8: Configuration of the buttons for AUTOMATIC operating state

![Figure 14: Position of the seal in the body casing](image)

ATTENTION!

Breakage of the pneumatic connection pieces due to rotational impact.

- When unscrewing and screwing in the body casing or transparent cap, do not hold the actuator of the process valve but the basic housing.

Damage or malfunction due to penetration of dirt and humidity.

- To observe degree of protection IP65 / IP67, screw the transparent cap in all the way.

→ Close the device (assembly tool: 67407714).

---

14) The assembly tool (674077) is available from your Bürkert sales office.
7.4 Function of the DIP switches

To operate the DIP switches and buttons, make sure that the local control lock is deactivated/unlocked (factory setting): with communication software or fieldbus communication.

ATTENTION!
Breakage of the pneumatic connection pieces due to rotational impact.

- When unscrewing and screwing in the body casing or transparent cap, do not hold the actuator of the process valve but the basic housing.

→ To operate the DIP switches, unscrew the transparent cap

</tr>
<tr>
<td></td>
<td>OFF</td>
<td>Operating status AUTOMATIC (AUTO)</td>
</tr>
</tbody>
</table>

15) Factory setting, can be changed via communications software.
16) The characteristic type can be changed via communications software.
**Information about the communications software:**

The switching position of the DIP switch has priority over the settings via the communications software.

If the values of the sealing function (CUTOFF) or the correction characteristic (CHARACT) are changed via the communications software, the corresponding function must be active (DIP switches set to ON). The effective direction of the set-point value (DIR.CMD) can be changed via the DIP switches only. If the correction characteristic (CHARACT) is not changed via the communications software, a linear characteristic is saved when DIP switch 3 is set to ON.

---

**ATTENTION!**

Breakage of the pneumatic connection pieces due to rotational impact.
- When unscrewing and screwing in the body casing or transparent cap, do not hold the actuator of the process valve but the basic housing.

Damage or malfunction due to penetration of dirt and humidity.
- To observe degree of protection IP65 / IP67, screw the transparent cap in all the way.

→ Close the device (assembly tool: 674077\textsuperscript{17}).

---

\textsuperscript{17} The assembly tool (674077) is available from your Bürkert sales office.
### 7.5 Display of the LEDs

<table>
<thead>
<tr>
<th>LED 1</th>
<th>Display of the device status and valve position (RGB)</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED 2</td>
<td>Display of the bus status (green)</td>
</tr>
</tbody>
</table>

- Feedback during pressing buttons to start functions:
  - X.TUNE
  - Device restart
  - Reset to factory settings

#### 7.5.1 Device status display

The LED 1 (RGB) show the device status.

The user can set the following LED modes for the display of device status and valve position:

- NAMUR mode
- Valve mode
- Valve mode with warnings (factory setting)
- Fixed color
- LED off

The LED mode and the colors of the valve position can be set with the Bürkert Communicator.

**IO-Link:**
The LED mode and the colors of the valve position can be also set with an acyclic parameter (see parameter list).

---

The description for setting the LED mode can be found in the chapter “16.2.10 Setting the LED mode, device status”.
7.5.1.1 Valve mode

Displays in valve mode:
• Valve position: open, half-way, closed
• Device status: Error

<table>
<thead>
<tr>
<th>Valve position</th>
<th>Valve position status, color</th>
<th>Device status: Error status, color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open</td>
<td>is lit yellow(^{18})</td>
<td>flashes red, alternately with yellow(^{18})</td>
</tr>
<tr>
<td>Half-way</td>
<td>is lit white(^{18})</td>
<td>flashes red, alternately with white(^{18})</td>
</tr>
<tr>
<td>Closed</td>
<td>is lit green(^{18})</td>
<td>flashes red, alternately with green(^{18})</td>
</tr>
</tbody>
</table>

Table 10: Valve mode

7.5.1.2 Valve mode + warnings

Displays in valve mode + warnings:
• Valve position: open, half-way, closed
• Device status: failure, function check, out of specification, maintenance required (according to NAMUR)

<table>
<thead>
<tr>
<th>Valve position</th>
<th>Device status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Status, color</td>
</tr>
<tr>
<td>Open</td>
<td>is lit yellow(^{18})</td>
</tr>
<tr>
<td>Half-way</td>
<td>is lit white(^{18})</td>
</tr>
<tr>
<td>Closed</td>
<td>is lit green(^{18})</td>
</tr>
</tbody>
</table>

Table 11: Valve mode + warnings, normal operation

If several device statuses exist simultaneously, the device status with the highest priority is displayed.

<table>
<thead>
<tr>
<th>Valve position</th>
<th>Device status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Status, color</td>
</tr>
<tr>
<td>Open</td>
<td>flashes red</td>
</tr>
<tr>
<td>Half-way</td>
<td>flashes red</td>
</tr>
<tr>
<td>Closed</td>
<td>flashes red</td>
</tr>
</tbody>
</table>

Table 12: Valve mode + warnings, device status

For warning messages, the LEDs are briefly switched off between the change of the colors.
For localizations, the colors are only shown momentarily.

\(^{18}\) Factory setting, selectable colors for the valve position: Off, white, green, blue, yellow, orange, red

\(^{19}\) As of firmware A.1.6
7.5.1.3 NAMUR mode

The device status LED show the device status.

The display elements change color in accordance with NAMUR NE 107.

If several device statuses exist simultaneously, the device status with the highest priority is displayed. The priority is determined by the severity of the deviation from controlled operation (red LED = failure = highest priority).

<table>
<thead>
<tr>

Table 16: Messages
8 INSTALLATION

8.1 Safety instructions

⚠️ DANGER!
Risk of injury from high pressure in the equipment/device.
- Before working on equipment or device, switch off the pressure and deaerate/drain lines.

Risk of electric shock.
- Before working on equipment or device, switch off the power supply and secure to prevent reactivation.
- Observe applicable accident prevention and safety regulations for electrical equipment.

⚠️ WARNING!
Risk of injury from improper installation.
- Installation may be carried out by authorized technicians only and with the appropriate tools.

Risk of injury from unintentional activation of the system and an uncontrolled restart.
- Secure system from unintentional activation.
- Following assembly, ensure a controlled restart.

8.2 Installation of the positioner Type 8694 on process valves of series 2103, 2300 and 2301

ATTENTION!
When mounting on process valves with a welded connection, follow the installation instructions in the operating instructions for the process valve.

Procedure:

1. Install switch spindle

![Diagram of installation](image)

Figure 18: Installation of the switch spindle (1), series 2103, 2300 and 2301

→ Un螺丝 the transparent cap on the actuator and unscrew the position display (yellow cap) on the spindle extension (if present).

→ For version with plug-in hose connector, remove the collets (white nozzles) from both pilot air ports (if present).
Installation

Figure 19: Installation of the switch spindle (2), series 2103, 2300 and 2301

**ATTENTION!**

Improper installation may damage the groove ring in the guide element.

The groove ring is already be pre-assembled in the guide element and must be “locked into position” in the undercut.

» When installing the switch spindle, do not damage the groove ring.

→ Push the switch spindle through the guide element.

**ATTENTION!**

Screw locking paint may contaminate the groove ring.

» Do not apply any screw locking paint to the switch spindle.

→ To secure the switch spindle, apply some screw locking paint (Loctite 290) in the tapped bore of the spindle extension in the actuator.

→ Check that the O-ring is correctly positioned.

→ Screw the guide element to the actuator cover (maximum torque: 5 Nm).

→ Screw switch spindle onto the spindle extension. To do this, there is a slot on the upper side (maximum torque: 1 Nm).

→ Push puck onto the switch spindle and lock into position.
2. Install sealing rings

→ Pull the form seal onto the actuator cover (smaller diameter points upwards).
→ Check that the O-rings are correctly positioned in the pilot air ports.

⚠️ When the positioner is being installed, the collets of the pilot air ports must not be fitted to the actuator.

---

3. Install positioner

→ Align the puck and the positioner until
   1. the puck can be inserted into the guide rail of the positioner (see “Figure 21”) and
   2. the connection pieces of the positioner can be inserted into the pilot air ports of the actuator (see also “Figure 22”).

ATTENTION!

Damaged printed circuit board or malfunction.

▶ Ensure that the puck is situated flat on the guide rail.
→ Push the positioner, without turning it, onto the actuator until no gap is visible on the form seal.

**ATTENTION!**

Too high torque when screwing in the fastening screw does not ensure degree of protection IP65 / IP67.

▶ The fastening screws may be tightened to a maximum torque of 1.5 Nm only.

→ Attach the positioner to the actuator using the two side fastening screws. In doing so, tighten the screws only hand-tight (max. torque: 1.5 Nm).

---

**8.3 Installing the positioner Type 8694 on process valves belonging to series 26xx and 27xx**

**Procedure:**

1. **Install switch spindle**

---

→ Unscrew the already fitted guide element from the actuator (if present).

→ Remove intermediate ring (if present).
→ Press the O-ring downwards into the cover of the actuator.

→ Actuator size ø125 and bigger with high air flow rate:
   remove existing spindle extension and replace with the new one. To do this, apply some screw locking paint (Loctite 290) in the tapped bore of the spindle extension.

→ Screw the guide element into the cover of the actuator using a wrench\textsuperscript{21} (torque: 8.0 Nm).

→ To secure the switch spindle, apply some screw locking paint (Loctite 290) to the thread of the switch spindle.

→ Screw the switch spindle onto the spindle extension. To do this, there is a slot on the upper side (maximum torque: 1 Nm).

→ Push the puck onto the switch spindle until it engages.

\textsuperscript{21) Journal Ø: 3 mm; journal gap: 23.5 mm}
2. Install positioner

→ Push the positioner onto the actuator. The puck must be aligned in such a way that it is inserted into the guide rail of the positioner.

ATTENTION!

Damaged printed circuit board or malfunction.

▶ Ensure that the puck is situated flat on the guide rail.

![Figure 25: Aligning the puck](image1)

→ Press the positioner all the way down as far as the actuator and turn it into the required position.

![Figure 26: Installing the positioner](image2)

Ensure that the pneumatic connections of the positioner and those of the valve actuator are situated preferably vertically one above the other. If they are positioned differently, longer hoses may be required other than those supplied in the accessory kit.

ATTENTION!

Too high torque when screwing in the fastening screw does not ensure degree of protection IP65 / IP67.

▶ The fastening screws may be tightened to a maximum torque of 1.5 Nm only.

→ Attach the positioner to the actuator using the two side fastening screws. In doing so, tighten the fastening screws hand-tight only (maximum torque: 1.5 Nm).
3. Install pneumatic connection between positioner and actuator

Figure 27: Installing the positioner

→ Screw the plug-in hose connectors onto the positioner and the actuator.
→ Using the hoses supplied in the accessory kit, make the pneumatic connection between the positioner and actuator with the following “Table 17: Pneumatic connection to actuator, CFA” or “Table 18: Pneumatic connection to actuator, CFB”.

ATTENTION!
Damage or malfunction due to ingress of dirt and moisture.
To observe degree of protection IP65 / IP67:

▶ In the case of actuator size ∅ 80, ∅ 100
connect the pilot air outlet which is not required to the free pilot air port of the actuator or seal with a plug.
▶ In the case of actuator size ∅ 125
seal the pilot air outlet 22 which is not required with a plug and feed the free pilot air port of the actuator via a hose into a dry environment.

#### Table 18: Pneumatic connection to actuator, CFB

"In rest position" means that the pilot valves of the positioner Type 8694 are isolated or not actuated.

---

**8.4 Rotating the actuator module**

⚠️ The actuator module (positioner and actuator) can be rotated for straight seat valves and angle seat valves belonging to series 2300, 2301 and 27xx only.

The position of the connections can be aligned steplessly by rotating the actuator module (positioner and actuator) through 360°.

⚠️ Process valves Type 2300, 2301 and 27xx: Only the entire actuator module can be rotated. The positioner cannot be rotated contrary to the actuator. The process valve must be in the open position for alignment of the actuator module.

### DANGER!

Risk of injury from high pressure in the equipment/device.

- Before working on equipment or device, switch off the pressure and deaerate/drain lines.

#### Procedure:

→ Clamp valve body in a holding device (only required if the process valve has not yet been installed).

### ATTENTION!

Damage to the seat seal or the seat contour.

- When removing the actuator module, ensure that the valve is in open position.

→ Control function A: Open process valve.
Using a suitable open-end wrench, counter the wrench flat on the pipe.

- Actuator module without hexagon:
  Fit special key\(^{22}\) exactly in the key contour on the underside of the actuator.

- Actuator module with hexagon:
  Place suitable open-end wrench on the hexagon of the actuator.

**WARNING!**

**Risk of injury from discharge of medium and pressure.**

If the direction of rotation is wrong, the body interface may become detached.

- Rotate the actuator module *in the specified direction only* (see “Figure 29”).

- Actuator module without hexagon:
  Rotate *clockwise* (as seen from below) to bring the actuator module into the required position.

- Actuator module with hexagon:
  Rotate *counter-clockwise* (as seen from below) to bring the actuator module into the required position.

---

22) The special key (665702) is available from your Bürkert sales office.
8.5 Rotating the positioner for process valves belonging to series 26xx and 27xx

If the connecting cables or hoses cannot be fitted properly following installation of the process valve, the positioner can be rotated contrary to the actuator.

![Diagram of positioner and actuator]

**Figure 30: Rotating the positioner, series 26xx and 27xx**

**Procedure**

→ Loosen the pneumatic connection between the positioner and the actuator.

→ Loosen the fastening screws (hexagon socket wrench size 2.5).

→ Rotate the positioner into the required position.

**ATTENTION!**

Too high torque when screwing in the fastening screw does not ensure degree of protection IP65 / IP67.

▶ The fastening screw may be tightened to a maximum torque of 1.5 Nm only.

→ Tighten the fastening screws hand-tight only (maximum torque: 1.5 Nm).

→ Re-attach the pneumatic connections between the positioner and the actuator. If required, use longer hoses.
9 PNEUMATIC INSTALLATION

9.1 Safety instructions

⚠️ DANGER!
Risk of injury from high pressure in the equipment/device.
▷ Before working on equipment or device, switch off the pressure and deaerate/drain lines.

⚠️ WARNING!
Risk of injury from improper installation.
▷ Installation may be carried out by authorized technicians only and with the appropriate tools.

Risk of injury from unintentional activation of the system and an uncontrolled restart.
▷ Secure system from unintentional activation.
▷ Following installation, ensure a controlled restart.

9.2 Connecting the device pneumatically

Figure 31: Pneumatic connection

Procedure:
→ Connect the control medium to the pilot air port (1) (3 – 7 bar; instrument air, free of oil, water and dust).
→ Attach the exhaust air line or a silencer to the exhaust air port (3) and, if available to the exhaust air port (3.1)

⚠️ Caution: (Exhaust air concept):
▷ In compliance with degree of protection IP67, an exhaust air line must be installed in the dry area.
Important information for the problem-free functioning of the device:

- The installation must not cause back pressure to build up.
- Select a hose for the connection with an adequate cross-section.
- The exhaust air line must be designed in such a way that no water or other liquid can get into the device through the exhaust air port (3) or (3.1).
- Keep the adjacent supply pressure always at least 0.5 – 1 bar above the pressure which is required to move the actuator to its end position. This ensures that the control behavior is not extremely negatively affected in the upper stroke range on account of too little pressure difference.
- During operation keep the fluctuations of the pressure supply as low as possible (max. ±10 %). If fluctuations are greater, the control parameters measured with the X.TUNE function are not optimum.

9.3 Manual actuation of the actuator via pilot valves

9.3.1 Single-acting actuators (control function A and B)

The actuator can be moved without a power supply from the rest position to its end position and back again. To do this, the pilot valves must be actuated with a screwdriver.

**ATTENTION!**

The hand lever may be damaged if it is simultaneously pressed and turned.
- Do not press the hand lever when turning it.

---

**Figure 32:** Pilot valves for aerate and deaerate the actuator

- Pilot valve non activated (normal position)
  - Hand lever to the left

- Pilot valve activated
  - Hand lever to the right
Move actuator to end position

Turn the hand levers to the right using a screwdriver.

Note:  
- do not press the hand levers when turning them  
- observe the sequence as described below

1. Actuate hand lever pilot valve deaeration.
2. Actuate hand lever pilot valve aeration.

Both hand levers point to the right.
The actuator moves to the end position.

Figure 33:  Move actuator to end position

Move actuator back to the rest position

Turn the hand levers to the left using a screwdriver.

Note:  
- do not press the hand levers when turning them  
- observe the sequence as described below

1. Actuate hand lever pilot valve aeration.

Both hand levers point to the left (normal position).
The actuator moves by spring force to the rest position.

Figure 34:  Move actuator back to the rest position

Caution:
If the pilot valves are actuated, electrical control is not possible.
- Move hand levers to normal position before starting up the device.
10  ELECTRICAL INSTALLATION 24 V DC

All electrical inputs and outputs of the device are not galvanically isolated from the supply voltage.

Two kinds of connections are used for the electrical bonding of the positioner:

- **Cable gland**
  with cable gland M16 x 1.5 and screw-type terminals

- **Multi-pole**
  with circular plug-in connector M12 x 1, 8-pin

10.1  Safety instructions

⚠️ **DANGER!**

Risk of electric shock.

- Before working on equipment or device, switch off the power supply and secure to prevent reactivation.
- Observe applicable accident prevention and safety regulations for electrical equipment.

⚠️ **WARNING!**

Risk of injury from improper installation.

- Installation may be carried out by authorized technicians only and with the appropriate tools.

Risk of injury from unintentional activation of the system and an uncontrolled restart.

- Secure system from unintentional activation.
- Following installation, ensure a controlled restart.

10.2  Electrical installation with circular plug-in connector

⚠️ **DANGER!**

Risk of electric shock.

- Before working on equipment or device, switch off the power supply and secure to prevent reactivation.
- Observe applicable accident prevention and safety regulations for electrical equipment.

![Diagram](image)

Figure 39: Position of the seal in the body casing

→ Check that the seal is correctly positioned in the body casing.

**ATTENTION!**

Breakage of the pneumatic connection pieces due to rotational impact.

▶ When unscrewing and screwing in the body casing, do not hold the actuator of the process valve but the basic housing.

Damage or malfunction due to penetration of dirt and humidity.

To ensure degree of protection IP65 / IP67:

▶ Tighten the union nut on the cable gland according to the cable size or dummy plugs used (approx. 1.5 Nm).
▶ Screw the body casing in all the way.

→ Tighten union nut on the cable gland (torque approx. 1.5 Nm).
→ Close the device (assembly tool: 67407725).

25) The assembly tool (674077) is available from your Bürkert sales office.

Use a 5-pin round plug and shielded 5-core cable.

The shielding in the device is not connected to the functional earth.
13 START-UP

13.1 Safety instructions

⚠️ DANGER!
Risk of injury from high pressure in the equipment/device.
▷ Before working on equipment or device, switch off the pressure and deaerate/drain lines.

⚠️ WARNING!
Risk of injury from improper operation.
Improper operation may result in injuries as well as damage to the device and the area around it.
▷ Before start-up, ensure that the operating personnel are familiar with and completely understand the contents of the operating instructions.
▷ Observe the safety instructions and intended use.
▷ Only adequately trained personnel may operate the equipment/the device.

13.2 Specifying the standard settings

The basic settings of the positioner are implemented at the factory.

⚠️ To adjust the positioner to local conditions, the X.TUNE function must be run following installation.

13.2.1 Running the automatic adjustment X.TUNE

⚠️ WARNING!
Danger due to the valve position changing when the X.TUNE function is running.
When the X.TUNE is running under operating pressure, there is an acute risk of injury.
▷ Never run X.TUNE while a process is running.
▷ Take appropriate measures to prevent the equipment from being accidentally actuated.

⚠️ ATTENTION!
Avoid maladjustment of the controller due to an incorrect pilot pressure or applied operating medium pressure.
▷ Run X.TUNE whenever the pilot pressure (= pneumatic auxiliary energy) is available during subsequent operation.
▷ Run the X.TUNE function preferably without operating medium pressure to exclude interference caused by flow forces.

⚠️ To run X.TUNE, the positioner must be in the AUTOMATIC operating status (DIP switch 4 = OFF).
ATTENTION!

Breakage of the pneumatic connection pieces due to rotational impact.

- When unscrewing and screwing in the body casing or transparent cap, do not hold the actuator of the process valve but the basic housing.

→ To operate the DIP switches, unscrew the transparent cap

![Diagram](image)

**Figure 42:** Open positioner

![Diagram](image)

**Figure 43:** Automatic adjustment X.TUNE

⚠️ To run X.TUNE, the positioner must be in the AUTOMATIC operating status (DIP switch 4 = OFF).

→ Start the X.TUNE by pressing button 1 for 5 s.

LED 2 flashes at 5 Hz. The device is in the NAMUR status function check, LED 1 lights orange.

If the X.TUNE is successfully completed, the NAMUR status is reset again. The changes are automatically transferred to the memory (EEPROM) provided the X.TUNE function is successful.

When LED 1 lights red after X.TUNE:

→ Execute X.TUNE again.

→ Perform a device restart if necessary.

26) The X.TUNE can also be started via communications software.
ATTENTION!

Breakage of the pneumatic connection pieces due to rotational impact.

▶ When unscrewing and screwing in the body casing or transparent cap, do not hold the actuator of the process valve but the basic housing.

Damage or malfunction due to penetration of dirt and humidity.

▶ To observe degree of protection IP65 / IP67, screw the transparent cap in all the way.

→ Close the device (assembly tool: 674077[27]).

13.3 Setting with Bürkert Communicator

The Bürkert Communicator can be used to make all settings on the device.

The settings in the Bürkert Communicator can be found in the operating manual.

13.3.1 Connecting IO-Link device with Bürkert Communicator

Required components:

• Communications software: Bürkert Communicator for PC
• USB-büS interface set (see accessories)
• büS adapter for büS service interface (see accessories)
• If necessary, a büS cable extension (see accessories)

ATTENTION

Breakage of the pneumatic connection pieces due to rotational impact.

▶ When opening or closing the device, do not press against the actuator, but against the basic housing.

→ Screw off the transparent cap by turning counterclockwise.

27) The assembly tool (674077) is available from your Bürkert sales office.
13.3.2 Connecting büS device with Bürkert Communicator

Required components:

- Communications software: Bürkert Communicator for PC
- USB-büS interface set (see accessories)

→ Establish connection to PC with USB-büS interface set.
→ Starting Bürkert Communicator.
→ Implementing settings.
14 IO-LINK

14.1 Information, IO-Link

IO-Link is an internationally standardized IO technology (IEC 61131-9) to enable sensors and actuators to communicate. IO-Link is a point-to-point communication with 3-wire connection technology for sensors and actuators and unshielded standard sensor cables. To ensure clear communication, the IO-Link devices should not be parameterised simultaneously by the higher-level controller (PLC) via the IO-Link master and with the Bürkert Communicator (via the service

Download from:
www.burkert.com / Type 8694 / Software
16  OPERATION AND FUNCTION

The positioner type 8694 has different basic and additional functions which can be configured and parameterized via the DIP switches or the communications software.

16.1  Basic functions

The following basic functions can be activated via the DIP switches (CUTOFF and CHARACT) or changed (DIR.CMD).

The parameters for the sealing function (CUTOFF) and characteristic correction (CHARACT) are set using the communication software.

<table>
<thead>

</tr>
<tr>
<td></td>
<td>OFF</td>
<td>No sealing function</td>
</tr>
</tbody>
</table>

Table 32: DIP switch 2

The communications software can be used to change the limits for the position set-point value as a percentage.

⚠️ The switching position of the DIP switches in the positioner has priority over the communications software, i.e. settings of the sealing function \((\text{CUTOFF})\) which are modified with the communications software are only active if DIP switch 2 in the positioner is set to ON.

![CUTOFF graph](image)

Figure 48: CUTOFF graph

\(^{29}\) Factory setting can be changed with communications software.
16.1.3 **CHARACT**

**Characteristic correction between input signal (position set-point value) and stroke**

Characteristic (customer-specific characteristic)

This function can be used to activate a transfer characteristic with respect to set-point value (set-point position) and valve stroke for correction of the flow-rate or operating characteristic.

The transfer characteristic can be changed via the communications software only.

Factory setting: DIP switch 3 set to OFF (linear)

<table>
<thead>
<tr>

</tr>
<tr>
<td>FREE</td>
<td>User-defined characteristic, freely programmable via nodes</td>
</tr>
</tbody>
</table>

30) The characteristic type can be changed with the communications software only.
The flow characteristic $k_V = f(s)$ indicates the flow-rate of a valve, expressed by the value $k_V$ as a function of the stroke $s$ of the actuator spindle. It is determined by the design of the valve seat and the seat seal. In general two types of flow characteristics are implemented, the linear and the equal percentage.

In the case of linear characteristics, equal $k_V$ value changes $dk_V$ are assigned to equal stroke changes $ds$.

$$(dk_V = n_{lin} \cdot ds).$$

In the case of an equal percentage characteristic, an equal percentage change of the $k_V$ value corresponds to a stroke change $ds$.

$$(dk_V/k_V = n_{eq\%} \cdot ds).$$

The operating characteristic $Q = f(s)$ specifies the correlation between the volumetric flow $Q$ in the installed valve and the stroke $s$. This characteristic has the properties of the pipelines, pumps and consumers. It therefore exhibits a form which differs from the flow characteristic.

![Characteristics](image)

**Figure 49: Characteristic**

In the case of control tasks for closed-loop control systems it is usually particular demands which are placed on the course of the operating characteristic, e.g. linearity. For this reason it is occasionally necessary to correct the course of the operating characteristic in a suitable way. For this purpose the positioner features a transfer element which implements different characteristics. These are used to correct the operating characteristic.

Equal percentage characteristics 1:25, 1:33, 1:50, 25:1, 33:1, and 50:1 as well as a linear characteristic can be set. A characteristic can be freely programmed using nodes.
Entering the freely programmable characteristic

The characteristic is defined by 21 nodes distributed uniformly over the position set-point values ranging from 0 – 100%. They are spaced at intervals of 5%. A freely selectable stroke (adjustment range 0 – 100%) is assigned to each node. The difference between the stroke values of two adjacent nodes must not be greater than 20%.

Example of a programmed characteristic

![Graph showing programmed characteristic](image)

**Figure 50:** Example of a programmed characteristic

### 16.1.4 INPUT - Enter the standard signal

Under this menu option, enter the unit signal used for the set-point value.

**Factory setting:** 4 – 20 mA, 4-wire

**Further settings:**
- 4 – 20 mA, 3-wire
- 0 – 20 mA, 4-wire
- 0 – 20 mA, 3-wire
16.1.5 **RESET** -
Reset to factory settings

This function can be used to reset the positioner to the factory settings.

16.1.6 **X.TUNE** -
Automatic calibration of the position controller

⚠️ **WARNING!**

The X.TUNE function must be run for a function check of the positioner to adjust to specific local features.

⚠️ **WARNING!**

While the X.TUNE function is running, the valve automatically moves from its current position.

- Never run X.TUNE while a process is running.
- Take appropriate measures to prevent the system / positioner from being unintentionally actuated.

**ATTENTION!**

Avoid maladjustment of the controller due to an incorrect compressed air supply or applied operating medium pressure.

- Run X.TUNE whenever the compressed air supply (= pneumatic auxiliary energy) is available during subsequent operation.
- Run the X.TUNE function preferably without operating medium pressure to exclude interference caused by flow forces.

⚠️ To run X.TUNE, the positioner must be in the AUTOMATIC operating state (DIP switch 4 = OFF).

→ Select **Automatic calibration of the position controller**.
→ Start X.TUNE. To do this, click **Next**.

The progress of X.TUNE is shown in the communication software:

When the automatic adjustment completes, a message appears.

The changes are automatically transferred to the positioner’s memory (EEPROM) after the X.TUNE function is successful.
16.2 Auxiliary functions

The following additional functions can be configured and parameterized via the communications software:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reversal of the effective direction of the actuator</td>
<td>Assignment of the aeration status of the actuator chamber to the actual position</td>
</tr>
<tr>
<td>DIR.ACT</td>
<td></td>
</tr>
<tr>
<td>Signal split range</td>
<td>Signal split range; input signal as a % for which the valve runs through the entire stroke range.</td>
</tr>
<tr>
<td>SPLTRNG</td>
<td></td>
</tr>
<tr>
<td>Stroke limit</td>
<td>Limit the mechanical stroke range</td>
</tr>
<tr>
<td>X.LIMIT</td>
<td></td>
</tr>
<tr>
<td>Limit actuating time</td>
<td>Limit the control speed</td>
</tr>
<tr>
<td>X.TIME</td>
<td></td>
</tr>
<tr>
<td>Control parameters</td>
<td>Parameterize the position controller</td>
</tr>
<tr>
<td>X.CONTROL</td>
<td></td>
</tr>
<tr>
<td>Safety position</td>
<td>Input the safety position</td>
</tr>
<tr>
<td>SAFEPOS</td>
<td></td>
</tr>
<tr>
<td>Cable break detection(^{31})</td>
<td>Configuration of signal level fault detection</td>
</tr>
<tr>
<td>SIG.ERROR</td>
<td></td>
</tr>
<tr>
<td>Digital input(^{31})</td>
<td>Activation of the digital input</td>
</tr>
<tr>
<td>BINARY.IN</td>
<td></td>
</tr>
<tr>
<td>Analog output(^{31})</td>
<td>Configuration of the outputs (only with auxiliary board for analogue feedback signal or digital outputs)</td>
</tr>
<tr>
<td>OUTPUT</td>
<td></td>
</tr>
</tbody>
</table>

Table 35: Auxiliary functions

\(^{31}\) Only for variant without fieldbus communication.
16.2.1  \textbf{DIR.ACT - Reversal of the effective direction of the actuator}

Use this function to set the effective direction between the aeration state of the actuator and the actual position.

Factory setting: Off (rise)

Rise: Direct effective direction (deaerated $\rightarrow$ 0 \%; aerated 100 \%)
Case: Inverse effective direction (deaerated $\rightarrow$ 100 \%; aerated 0 \%)

\begin{figure}[h]
\centering
\includegraphics[width=0.5\textwidth]{DIR_ACT_graph.png}
\caption{DIR.ACT graph}
\end{figure}
16.2.2 SPLTRNG - Signal split range

Minimum and maximum values of the input signal as a % for which the valve runs through the entire stroke range.

Factory setting: Lower signal range split = 0 %; Upper signal range split = 100 %

Lower value split range: Input the minimum value of the input signal as a %
Adjustment range: 0 – 75 %

Upper value split range: Input the maximum value of the input signal as a %
Adjustment range: 25 – 100 %

Use this function to limit the position set-point value range of the positioner by specifying a minimum and a maximum value. This makes it possible to divide a unit signal range that is used (4 – 20 mA, 0 – 20 mA) into several positioners (without or with overlapping). This allows several valves to be used alternately or, in the case of overlapping set-point value ranges, simultaneously as actuators.

To split a unit signal range into two set-point value ranges:

![Graph of SPLTRNG](image)

**Figure 52: SPLTRNG graph**
16.2.3  **X.LIMIT** - Stroke limit

This function limits the (physical) stroke to specified % values (lower and upper). In doing so, the stroke range of the limited stroke is set equal to 100 %. If the limited stroke range is left during operation, negative actual positions or actual positions greater than 100 % are shown.

Factory setting: Lower position limit = 0 %, upper position limit = 100 %

Adjustment ranges:

- Stroke limit minimum: 0 – 50 % of the entire stroke
- Stroke limit maximum: 50 – 100 % of the entire stroke

The minimum distance between the upper and lower stroke limit is 50 %. Therefore if one value is entered with a minimum distance of < 50 % the other value is adjusted automatically.

---

**Figure 53: X.LIMIT graph**
16.2.4  **X.TIME** - Limit actuating time

Use this function to specify the opening and closing times for the entire stroke and thereby limit control speeds.

⚠️ When the **X.TUNE** function is running, the minimum opening and closing time for the entire stroke is automatically entered for Open and Close. Therefore, movement can be at maximum speed.

Factory setting: values determined at the factory by the **X.TUNE** function

If the control speed will be limited, values can be input for Open and Close which are between the minimum values determined by the **X.TUNE** and 60 seconds.

- **Opening time**: Opening time for entire stroke (in seconds)
  - Adjustment range: 1 – 60 seconds
- **Closing time**: Closing time for entire stroke (in seconds)
  - Adjustment range: 1 – 60 seconds

**Effect of limiting the opening speed when there is a jump in the set-point value**

---

![X.TIME graph](image)

*Figure 54: X.TIME graph*
16.2.5 **X.CONTROL** -
Control parameters of the positioner

Use this function to set the parameters for the positioner (dead band and amplification factors (kp)).

**Deadband:** Insensitivity range of the positioner

Entry for the deadband as a % in reference to the scaled stroke range; i.e. stroke limit maximum - stroke limit minimum (see auxiliary function stroke limit ($X.LIMIT$)).

This function causes the controller to respond only beginning at a specific control difference. This function saves wear on the solenoid valves in the positioner and the pneumatic actuator.

![Warning](Note: If the auxiliary function control parameters ($X.CONTROL$) is in the main menu while $X.TUNE$ (Autotune of the positioner) is running, the deadband is determined automatically depending on the friction behavior of the actuator. The value determined in this way is an approximate value. You can re-adjust it manually.)

![X.CONTROL Graph](Note: Figure 55: X.CONTROL graph)

**Open/close amplification factor:** Parameters for the positioner

- **Open amplification factor:** Amplification factor of the positioner (for closing the valve)
- **Close amplification factor:** Amplification factor of the positioner (for opening the valve)

16.2.6 **SAFPOS** -
Definition of the safe position

This function specifies the actuator safety position which is approached at defined signals.

![Warning](Note: The set safety position is only approached if there is a corresponding signal at the digital input (for configuration see digital input ($BINARY.IN$)) or if a error occurs. If the mechanical stroke range is limited with the stroke limit function ($X.LIMIT$), only safety positions within these limits can be approached. This function is executed in AUTOMATIC mode only.)
16.2.7 **SIG.ERROR** -
Configuration of cable break detection (only for variant without
fieldbus communication)

The cable break detection function (SIG.ERROR) is used to detect a fault on the input signal.

Cable break detection can be selected for a 4 – 20 mA signal only:
Fault if input signal ≤ 3.5 mA (± 0.5 % of final value, hysteresis 0.5 % of final value)
If 0 – 20 mA is selected, cable break detection cannot be selected.

A signal error is indicated on the device by the LED 1 for activated cable break detection (error or out of spezification).

**Safety position for activated cable break detection:**
Active safe position function (SAFEPOS)
If a fault is detected, the actuator moves to the position set under safe position function.
Inactive safe position function (SAFEPOS)
If a fault is detected, the actuator moves to the end position which it would assume in the isolated state.

16.2.8 **BINARY.IN** (variant) -
Configuration of the digital input (only for variant without
fieldbus communication)

The following settings can be implemented:
• Approach the safety position
• Starting the function X.TUNE

**Safety position**
Digital input = 1 → Approach the safety position.
Active safety position function (SAFEPOS)
The actuator moves to the position set under safe position function.
Inactive safety position function (SAFEPOS)
The actuator moves to the end position which it would assume in the isolated state.

Starting the function X.TUNE
Digital input = 1 → Starting X.TUNE.
### 16.2.9 OUTPUT (variant) - Configuration of the analog output (only for variant without fieldbus communication)

The function analog output (OUTPUT) only appears in the selection of functions if the positioner has an analog output (variant) or if no parameters have been read in yet.

The analog output can be used for feedback of the current position or of the set-point value to the control center.

18 MAINTENANCE

18.1 Safety instructions

⚠️ DANGER!
Risk of injury from high pressure in the equipment/device.
▸ Before working on equipment or device, switch off the pressure and deaerate/drain lines.

Risk of electric shock.
▸ Before working on equipment or device, switch off the power supply and secure to prevent reactivation.
▸ Observe applicable accident prevention and safety regulations for electrical equipment.

⚠️ WARNING!
Risk of injury from improper maintenance.
▸ Maintenance may be performed by authorised technicians only.

Risk of injury from unintentional activation of the system and an uncontrolled restart.
▸ Secure system from unintentional activation.
▸ Following maintenance, ensure a controlled restart.
18.2 Service at the air intake filter

⚠️ DANGER!
Risk of injury from high pressure in the equipment/device.
- Before working on equipment or device, switch off the pressure and deaerate/drain lines.

To protect the internal solenoid valves and the actuator, the pilot air is filtered.
The direction of flow of the air intake filter in installed state is from the inside to the outside through the filter material.

![Figure 56: Service on the air intake filter](image)

Procedure:

→ Unlock the quick connector by pressing the holding element and pulling out the air intake filter (if necessary, use a suitable tool in between the recesses in the head of the filter).
→ Clean the filter or, if necessary, replace the filter.
→ Check inner O-ring and, if required, clean.
→ Insert the air intake filter all the way into the quick connector.

⚠️ DANGER!
Risk of injury due to improper installation.
- Ensure that the air intake filter is installed correctly.

→ Check that the air intake filter is secure.

- büS cable extension (M12 pin to M12 socket), length 10 m 772407

Table 37: Accessories

19.1 Communications software

The PC operating program “Communicator” is designed for communication with the devices from the Bürkert positioner family (valid since serial number 20000).

A detailed description and precise schedule of the procedure for the installation and operation of the software can be found in the associated documentation.

Download the software at: www.burkert.com
20 DISASSEMBLY

20.1 Safety instructions

⚠️ DANGER!
Risk of injury from high pressure in the equipment/device.
- Before working on equipment or device, switch off the pressure and deaerate/drain lines.

Risk of electric shock.
- Before working on equipment or device, switch off the power supply and secure to prevent reactivation.
- Observe applicable accident prevention and safety regulations for electrical equipment.

⚠️ WARNING!
Risk of injury from improper disassembly.
- Disassembly may be carried out by authorized technicians only and with the appropriate tools.

Risk of injury from unintentional activation of the system and an uncontrolled restart.
- Secure system from unintentional activation.
- Following disassembly, ensure a controlled restart.

20.2 Disassembly the positioner

Procedure:

1. Pneumatic connection

⚠️ DANGER!
Risk of injury from high pressure in the equipment/device.
- Before working on equipment or device, switch off the pressure and deaerate/drain lines.

→ Loosen the pneumatic connection.
→ Series 20xx:
    Loosen the pneumatic connection between positioner and actuator.
2. Electrical connection

**DANGER!**

**Risk of electric shock.**

- Before working on equipment or device, switch off the power supply and secure to prevent reactivation.
- Observe applicable accident prevention and safety regulations for electrical equipment.

Circular plug-in connector:

→ Loosen the circular plug-in connector.

Cable gland:

→ Open the positioner: unscrewing the body casing in an anticlockwise direction.
→ Unscrew the screw terminals and pull out cables.
→ Close the positioner.

3. Mechanical connection

→ Loosen the fastening screws.
→ Remove the positioner upwards.

---

**Figure 57: Disassembly the positioner**
