## INTRODUCTION

- This manual is integral part of the product. Read carefully the instructions contained since it contains important indications for the safety of use and of maintenance.
- The technical information and the relative products of this manual could be modified without any previous notice.
- The flowmeter must be used for the use it has been built for. The improper use, possible tampering of the instrument or parts of it and substitutions of any components not original, makes the warranty to decay automatically.
- The manufacturer is considered responsible only if the instrument is used in its original configuration and setting.
- The flowmeter makes measures of liquids with conductivity greater than $5 \mu \mathrm{~S} / \mathrm{cm}$; it consists of a sensor (described in this manual) and a converter, for it see the manual provided.
- If the sensor is supplied in compact version to the converter, consider the operating temperatures more restrictive, otherwise refer to the respective manuals.
- When transporting, unpacking and handling the flowmeter, be careful and care.
- In the case of prolonged storage and of transport, use and store in the original container in a dry place, do not place more than 3 packs one above the other. It is possible pallets storage and transport (in case of wooden crates do not place one above the other).
- For the cleaning of the device use only a damp cloth, and for the maintenance/repairs, contact the customer service.
- For the disposal of the device and of the packaging make strict reference to the regulations.
- It is forbidden the reproduction of the present manual and of possible software supplied with the instrument.

## START UP AND MAINTENANCE OF THE INSTRUMENTS

- Before starting up the instrument, always make a secure connection to ground as suitable to page 6.
- Verify periodically: the cables integrity, the tightening of the sealing elements (cable glands, covers, etc.), the mechanical fixing of the instrument on the pipe or on the wall.

## SAFETY

Before using the instrument, always make a secure connection to the ground

Avoid any attempt to repair the instrument. If the instrument is not functioning properly, please call the nearest assistance service

Pay maximum attention during the operations

ATTENTION !!

DANGER !!!

## GENERAL INFORMATION ON THE SENSORS INSTALLATION

The manufacturer recommends cleaning the instruments before use.

## Flow direction

Before install the sensor locate the direction of the liquid in the piping
The sign of the flow rate is positive, when the flow direction is from - to + as printed on the tag plate. If after the installation, for plant request becomes necessary reverse the sign of the flow, it is enough reverse the sign of the coefficient KA

For installations in long pipe lines, please use anti vibration joints

Avoid a partially empty pipe, during operation the pipe must be either completely full of liquid

## DEGREE OF PRODUCT CLEANLINESS

Non Volatile Residue (NVR) Gravimetric test

Non Volatile Residue (NVR) TOC

The degree of cleaning of the product has been determined in accordance with the following standards

ASTM G 93-03: Cleaning Methods and Cleanliness Levels for Material and Equipment Used in Oxygen-Enriched Environments;
ASTM F331-05: Standard Test Method for Nonvolatile Residue of Solvent Extract from Aerospace Components (Using Flash Evaporator);
ASTM G 144-01: Standard Test Method for Determination of Residual Contamination of Materials and Components by Total Carbon Analysis Using a High Temperature Combustion Analyzer.

## Par. 11.4.2.2 Total Organic Carbon:

When water is used as a quantitative verification, the ultrasonic extraction in aqueous phase is used to release organic substances and particulate from the surfaces of the fittings and from the piece to determine the total organic carbon.
G 136: Practice for Determination of Soluble Residual Contaminants in Materials by Ultrasonic Extraction

From the evaluation of the NVR parameter, as gravimetric determination of processing residues, there is a level of cleaning of $D$ band level for diameters up to DN 20 mm
For DN> $=20 \mathrm{~mm}$ it is less than $33 \mathrm{mg} / \mathrm{m} 2$ classifiable as band $B$. Consequently, for DN $<20 \mathrm{~mm}$, an additional washing cycle may be required by the user, according to methods considered suitable for the use to which the product is destined and with liquids that are compatible with the materials of the product

From the evaluation of the NVR parameter, such as determination of organic residues, the level of cleanliness is of band $A$, therefore the cleaning process carried out can be considered adequate and sufficient. In any case, it is left to the discretion of the user to provide for additional cleaning deemed suitable for the use to which the product is destined and with liquids that are compatible with the materials of the product

## ELECTRICAL CONNECTIONS OF SENSOR TO TRANSMITTER (Connections to transmitter: see related manual)

## GROUNDING INSTRUCTIONS

For correct operation of the meter, it is NECESSARY that the sensor and the liquid are equipotential, so ALWAYS connect the sensor and converter to ground:

## INSPECTION SCREW (VALID ONLY FOR DN 3-20)

## SENSOR SELF-DRAINING

When flowmeter is installed horizontally, ensure minimum angle of $3^{\circ}$ for self draining purposes

At the end of its useful life, this product must be disposed of in full compliance with the environmental regulations of the country in which it is located.
